Cities are taking a central role in shaping our common future. To better steer and coordinate our efforts, we need better metrics. Recent years have allowed improved city metrics to emerge, thanks to (1) new and better fact-based data, and (2) new priorities devoted in cities and urban matters to broad issues like human-centricity, innovation, or sustainability, for example.

Such issues have been at the core of WeGO's mission since its inception. We are hence very proud to be associated with this first edition of the new POSITIVE index of cities, also known as the Cities Future Readiness Index (CFRI).

The World Smart Sustainable Cities Organization (WeGO) is a city-based international organization that has worked on the mission of promoting the worldwide transformation of cities into human-centric smart cities for the past 14 years. Currently, WeGO has 201 members, including 157 local governments, 22 corporations, and 22 other institutions. Members are distributed across the world.

As such, it is at the core of a constant maelstrom of ideas and information about the latest concerns, expectations, and achievements of cities on a global scale. We are happy to bring that experience and daily practice to the benefit of this first edition of CFRI and look forward to subsequent ones.

We hope that this new index will be of value to urban decision makers – public and private – as well as to anyone interested in assessing the performance of cities worldwide, and their ability to improve the well-being of their citizens, today and in the future.

A handwritten signature in black ink, appearing to read 'JK Kim'.

Jeong-kee Kim

Secretary General of World Smart Sustainable Cities Organization (WeGO)

Preface

Like an alpinist facing the challenge of a yet unconquered summit, cities are opening new paths to the future. Their efforts are fraught with uncertainties, and the dangers that come with trying new approaches and adopting innovative strategies.

Benchmarking such efforts, and keeping track of their outcome is a critical ingredient to improve our collective knowledge on urban matters, and to help cities to benefit from the attempts of pioneers, and improve their own efficiency and competitiveness.

By offering a new index, this report aims at combining three imperatives, namely :

We need to leverage the growing corpus of hard data available to describe cities' efforts, challenges and results,

We need to provide an encompassing view of cities' strategies, i.e. one that should not focus only on technology and innovation, but also on how citizens live, learn, work and entertain, and

We need to do all of this in a way that takes due account of the growing uncertainties and accelerating changes that surround cities.

For all these reasons, building a positive index able to describe how cities are preparing themselves for tomorrow's challenges and opportunities has been our priority for years. It has now come into a brand new global benchmarking and action tool: the Cities Future Readiness Index (CFRI).

We at Descartes Institute are very grateful for the support received from WeGO to produce this first edition, as well as for the collaboration received from the University of Geneva's Centre of Excellence on Smart Sustainable Cities and Sustainable Urban Development.

Feedback and reactions from its users (central and local governments, urban planners, architects, social scientists and anyone interested in future-readiness and urban matters) will guide us to make CFRI an even better and more impactful index in the years to come.

A stylized, handwritten signature in blue ink, consisting of a large, flowing 'B' followed by a series of loops and a horizontal stroke.

Bruno Lanvin
Descartes Institute, President

SECTION ONE

Cities open new paths to future readiness

On a global scale, we are living, at a pivotal moment, where everything could take a turn for the worse or for the better, depending on the priority we give to urban planning issues.

Jacques Attali,
Histoires et Avenirs des Villes (2024), page 16

Introduction

In the upcoming new wave of globalizations, cities will be playing many of the roles traditionally attached to nation states. Considering that current times are witnessing an acceleration of history, it is clear that our collective ability to shape our future will largely be illustrated by the ways in which the majority of mankind will be prepared for such a future. By 2050, two thirds of human beings will be living in cities, creating the need to provide housing to more than 2.5 billion people, a large majority of which in emerging and poor countries.

Located in what is now the northwestern part of Iran, the city of Hamadan was founded more than 3,000 years ago. Formerly known as Ecbatana, the capital of the Median Empire around 700 BCE, to its role as a summer capital for later Achaemenid and Parthian kings. It has been a major cultural and trade centre influencing and being influenced by a large array of civilizations. The city's design is strikingly modern, and can be regarded as a model of what 'future readiness' meant a few millennia ago. Like the mountain climber at the bottom left, we now need to identify and open new routes towards designing, building and running future-ready cities.

Why a new index?

To achieve this, metrics are essential. Cities and citizens need to be able to benchmark their own efforts, and to compare them to what other cities have achieved or attempted. Over the last decade, a number of valuable efforts have been developed along those lines. However, they remained limited by the scarcity of data. Contrary to the data collected at national level – which are routinely published by respected international organizations, harmonized and standardized in ways that allow meaningful comparisons, city-level data have remained a rare and uneven commodity. As a result, global indices have often relied on opinion surveys.

Figure 1: Mountain climber & the city of Hamadan

Over the last few years, however, the data landscape of cities has improved significantly. More reliable data have become available, often published in rigorous and harmonized ways.

To some extent, this change in the data landscape around cities echoes several fundamental changes in the perceived roles of cities on the global scene. Three of these changes call for new metrics about both cities and future readiness.

- *New roles for cities* - The rapid collapse of multilateralism and the concurrent resurgence of nationalistic policies have contributed to a spectacular retreat by nation states from some of their once prominent roles on the global scene. As a result, cities and regions have emerged as the places where to look for vibrant cross-border cooperation and innovative governance.

- *Smart city backlash* - A second change that has been seen on the global city scene – in particular over the last few years – has been a ‘smart city backlash’, reflecting a general erosion of citizens’ trust in technology and technology companies.
- *Longer term issues* - Last but not least, growing concerns and debates about global issues (sustainability, human centricity, innovation, inclusion, quality of life to name a few) have continued to structure international and local debates, while progressively taking a more visible and down-to-earth (action oriented) turn.

All of these changes now need to be reflected in a set of innovative action-oriented tools that can help city designers, planners, managers, leaders, citizens, investors and related actors to assess, compare and improve their approaches to shape cities in ways that better address current and future challenges, while contributing to build a safer, more prosperous and fairer global society.

This is the spirit in which, over the last few years, the Cities Future Readiness Index has been designed and built.

What makes this new index different and valuable?

The Cities Future Readiness Index offers a unique combination of seven important characteristics: hard data, reputation, rigorous independence, originality, adaptability, coverage and usability.

Hard data – As underlined earlier, the emergence of reliable and consistent hard data has been one of the major trends affecting city-centric analyses over the last few years. In CFRI, we used those data to the maximum extent possible. Some national (country-based) data are used whenever the preferred city-level data is not available or not of sufficient quality. National-level data is also used for indicators that do not vary within a specific country (e.g. taxation).

Reputation – The model building and analyses underpinning CFRI rely on some thirty years of experience from the Descartes team in producing widely used and recognized global indices (Network Readiness Index, Global Innovation Index, Global Talent Competitiveness Index, Global City Talent Competitiveness Index for example). To produce and refine CFRI, the Descartes team benefitted from continuous feedback from urban experts and city

leaders (for example through the WeGo global network of cities, the UN Charter Center of Excellence of the University of Geneva, the University of Lausanne, and various foundations and NGOs active in areas such as urban sustainability and human-centric urban design, such as the Braillard Foundation in Geneva).

Independence and rigor – As in the model firmly established in the production of the global indices mentioned above, CFRI remains totally independent from any methodological inference, including from its donors and sponsors. Strict control mechanisms are applied to the data collected, and all elements of the index (including its model and calculation methods) fit the highest criteria of academic rigor. All methods used in CFRI, as well as the choices made regarding data and calculations are explicitly described in technical annexes to the CFRI report.

Originality – Because it relies on a unique set of hard data (mostly at city level), CFRI is already in a category of its own of city-related indices. Moreover, the deliberate choice made by its conceptors to offer a benchmarking tool immune to the negative connotation that the phrase ‘smart city’ has gathered in the recent past, offers a POSITIVE definition of city performance. Its dual approach to ‘inputs’ vs ‘outputs’ of cities offers a rich basis for future analyses of cities strategies and performances (especially when time series start to emerge from upcoming editions). Its emphasis on human centricity, innovation and sustainability is reflected in its eight-pillar structure.

For ease of memorization and usage, the initials of the keywords used to name those eight pillars spell the word POSITIVE : People centricity, Openness, Sustainability, Institutions, Technology, Innovation, Vibrancy and E-readiness. More details will be provided on the model and CFRI methodology in the section ‘Methodology and key results’ below.

Adaptability – It is likely that the volume and quality of the data CFRI relies on will continue to increase in scope, coverage and quality. New concerns and opportunities may arise in the fields of urban design, governance and management. CFRI’s structure is therefore not cast in stone. It will continue to adapt, and reflect current realities. Efforts will be made however to maintain continuity and consistency in the approach proposed, in particular with a view to generating the time series necessary to dynamic analyses and forecast.

Figure 2: Cities Future Readiness Index

Global coverage – Contrary to nation states, cities do not constitute a closed set, for which one could rely on an established definition. Most national-level global indices rely on UN membership to identify and designate nation states. Their number remains under 200, making them a proper target for global benchmarking. Cities on the other hand are too numerous to discourage any attempt at ‘full coverage’. A credible global index of cities must hence be based on choices, and this is why (1) CFRI aims at limiting its coverage to around 100 cities, (2) efforts will continue to be made to ensure that this sample reflects the variety of cities across the world, in terms of geographies, size and level of development, in particular.

Usability – CFRI is not about ‘handing medals’ and identifying ‘good cities’ vs ‘bad cities’. It has been designed to be an action tool. The rankings offered are only the tip of the iceberg: city leaders and managers, investors, city designers and ordinary citizens should be able to find value in using this index to better inform their own decisions. To achieve this, deliberate choices have been exercised to make CFRI highly readable and understandable (for instance, no weighing is used). Moreover, the annual publication of the CFRI report will be accompanied by the release of a number of hands-on products (dynamic website, city profiles, thematic analyses and case studies) that should empower users to build their own assumptions, test scenarios and gather in-depth information of specific cities and their respective strategies and results.

Methodology and key results

A POSITIVE model

The model underlying the Cities Future Readiness Index (CFRI) is built on an Input-Output framework. This approach distinguishes between a city's enabling environment and endowments on the one hand, and the ability of a city to translate these resources into tangible outcomes on the other. The resulting model is structured around eight pillars, summarised by the acronym **POSITIVE**:

- **P**eople Centricity
- **O**penness
- **S**ustainability
- **I**nstitutions and Governance
- **T**ransport and Infrastructure
- **I**nnovation
- **V**ibrancy
- **E**-Readiness

The first five pillars belong to the Input dimension, whereas the final three form part of the Output dimension (see Figure X). Each pillar consists of two sub-pillars that, in turn, are composed of two to four variables. Altogether, the POSITIVE model is populated by 44 indicators: 32 based on quantitative data and 12 derived from index/composite indicator data.

The model's structure assigns each indicator to both a pillar and a sub-pillar. This relationship is captured in a three-digit prefix attached to each indicator name: the first digit denotes the pillar, the second the sub-pillar, and the third the specific indicator. For example, indicator 1.2.3 refers to the third indicator (Mean years of schooling), which belongs to the second sub-pillar (Access to Services) under the first pillar (People Centricity).

Figure 3: The POSITIVE model underlying the CFRI

City definition, geographic coverage, and data sources

Although cities have formal municipal borders, their true geographical reach and influence are less clear-cut. Any assessment of city performance therefore requires a precise definition of what constitutes a city. As outlined in Section X, four main approaches to delineation can be distinguished:

- Urban localities, defined by administrative boundaries;
- Urban agglomerations, covering continuously built-up areas;
- Functional urban areas (FUAs), based on commuting patterns around a city centre; and
- Conurbations, which merge closely linked urban regions.

The CFRI primarily works with the FUA definition for two main reasons. First, it is conceptually the most relevant, as it captures both the city centre and its commuting zone, offering a more complete view of the social and economic footprint of the urban area. Second, it is a practical choice in terms of data, since it aligns with the OECD's methodology for estimating the economic and functional reach of cities.

The CFRI is designed as a truly global index, encompassing cities across all continents. While many of the included cities are national capitals, the index also covers other major urban centres of economic or strategic importance. Larger countries such as the United States, China, and India are represented by multiple cities to reflect their diverse urban systems.

In total, the CFRI includes 102 cities spanning 75 countries. Of these, 46 belong to OECD member states and are delineated primarily as functional urban areas, following OECD definitions. For the remaining cities, delineations draw mainly on the Large Urban Regions (LURs) database developed by Rozenblat et al. (2024), while also taking into account the specificities of the underlying data sources.

The OECD Data Explorer is a primary source of statistics on cities and regions in OECD countries. To achieve global coverage, these data were complemented with information from international sources including UN-Habitat, the UN SDG Global Database, the International Labour Organization

(ILO), and the World Health Organization (WHO). Several indicators were drawn from specialized sources such as PATENTSCOPE (World Intellectual Property Organization), the Forbes Global 2000, fDi Markets, and the TomTom Traffic Index. Where necessary, local sources—including government websites, official reports, and press releases—were also consulted to obtain or validate specific city-level values.

Treatment of data

Despite extensive efforts to collect city-level data, gaps remain. To address these, missing values were imputed according to a stepwise approach. First, data were proxied using values from other cities within the same country. Second, where appropriate, values were drawn from the surrounding region or from national-level data. Only when no reliable proxy was available was a value recorded as missing (n/a).

Outliers in indicator data can distort results and introduce bias into the rankings. To limit this effect, potential outliers are identified and addressed prior to score normalization. A simple diagnostic rule is applied: indicators with an absolute skewness above 2 or a kurtosis above 3.5 are flagged as containing outliers.¹ Two approaches are then used for treatment. When the number of outliers does not exceed four, the indicator is winsorised—that is, extreme values are adjusted to match the next highest or lowest observation. This adjustment is repeated until the skewness and kurtosis values fall within the acceptable thresholds. However, for indicators with at least five outliers a second approach is followed, whereby the data are transformed by natural logarithms according to the following formula:

ln [(max x factor - 1) x (value - min) / (max - min) + 1]

To enable aggregation, indicators are first normalised so they can be compared on a common scale. The CFRI adopts the min-max normalisation method, which rescales all values to a range between 0 and 100, where higher scores reflect stronger performance. For the majority of indicators—classified as “goods,” where higher values indicate better outcomes—the standard min-max formula is applied:

100 x (value - min) / (max - min)

Conversely, for indicators considered “bads,” where higher values denote weaker outcomes, a reverse normalization formula is used to ensure consistency in the interpretation of scores:

$$100 \times \frac{(\text{max} - \text{value})}{(\text{max} - \text{min})}$$

Computation of the index

The calculation of future readiness follows a stepwise aggregation process, moving from the level of indicator up to the level of the pillar. The composite measure is constructed using unweighted arithmetic means at each level. Aggregation takes place in three stages: first, combining individual indicators within each sub-pillar; second, averaging sub-pillars to form the pillars; and finally, calculating the mean of the eight pillars to generate the overall index of city future readiness.

Endnotes

¹ This rule is adopted from Groeneveld & Meeden (1984).

² Winsorisation was needed for 10 indicators: 1.1.3 Safety; 1.2.1 Hospital bed density; 2.1.2 FDI projects; 2.2.2 Unemployment; 3.2.1 Greenhouse gas emissions; 3.2.2 Waste collection; 6.2.3 Science and technology intensity; 7.2.1 Museums; 7.2.2 Events; and 8.2.1 Software development.

³ The formula ensures that natural logarithms are positive and start at zero. Eight indicators needed to be log transformed: 2.1.1 Headquarter presence; 2.1.3 FDI job creation; 6.2.1 Patents; 6.2.2 Science and technology clusters; 7.1.1 Startup scene; 7.1.2 Firm ownership linkages; 7.1.3 Firm subsidiary linkages; and 8.2.2 AI patents.

⁴ Reverse normalisation was needed for seven indicators: 1.1.3 Safety; 2.2.2 Unemployment; 2.2.3 Youth inclusion; 3.1.1 Air quality; 3.2.1 Greenhouse gas emissions; 5.1.1 Traffic safety; and 5.1.3 Traffic travel times.

Overall Results

The Cities Future Readiness Index (CFRI) 2025 covers a total of 102 cities from all over the world. Cities of all types are included.

Population sizes, for instance, range from Geneva with fewer than a million inhabitants (600,000) to megacities like Tokyo (36 million), Shanghai (25 million), and Seoul (24 million). The median population is just below 5 million. The income levels of the cities display a similarly large variation: from an estimated GDP (in purchasing power parity, PPP) per capita of roughly US\$ 4,500 in Dar es Salaam to an affluent high of US\$ (PPP) 155,000 in San Francisco (the estimated median income level per capita is US\$ (PPP) 46,200). Some two-thirds of the cities are capital cities.

In all, 75 countries are represented in the index, with the US, China, and India featuring most cities (six, five, and four, respectively). In terms of region, Asia and Pacific and Europe have the highest number of cities in the index (32 and 29, respectively) followed by Sub-Saharan Africa (13), Middle East and Northern Africa (12), Northern America (8), and Latin America (8). As for income group variation, they span the full spectrum of income groups: low income (3 countries), lower-middle income (22), upper-middle income (23), and high income (54).

The world's most future-ready city in 2025 is **London** (Table 1), whose blend of financial dynamism, cultural vitality, and global reach continues to attract talent and investment from around the world. It is closely followed by **San Francisco** in second place,

recognised for its global leadership in innovation and its role as a digital trailblazer. Rounding out the top-3 is another innovation hub in the US known for its world-class research: **Boston**.

The remaining top-10 future-ready cities include two other vibrant global cities – **Paris** (4th) and **New York** (5th) – both distinguished by their strong financial sectors and rich cultural life. They are followed by three small and mid-sized European cities—**Copenhagen**, 6th; **Zurich**, 7th; **Stockholm**, 8th—all of which tick many boxes for smart, sustainable urban development. The final two cities in the top-10 are in the Asia and Pacific region: **Singapore** (9th), renowned for its institutional environment, and **Seoul** (10th) which combines a dynamic innovation ecosystem with a strong people-centric focus.

Beyond the top-10 list are cities of similarly diverse sizes and profiles. For instance, smaller European cities like **Helsinki** (11th), **Geneva** (15th), **Oslo** (17th), and Frankfurt (25th) feature alongside major metropolises in East Asia—**Tokyo** (12th) and **Hong Kong** (14th)—and in Australia—**Melbourne** (22nd) and **Sydney** (23rd). The remaining cities in the top-25 are located in Europe and Northern America (both Canada and the US). In sum, the best-performing cities in the index range from the small to the largest cities in the world, and can be found across several continents. The one thing that they have in common, however, is that all of them are situated in high-income countries.

The next section discusses in greater detail the future readiness of the CFRI top-10 and other notable cities.

Table 1. Cities Future Readiness Index 2025: ranks and scores

City	Rank	Score	Country
London	1	74.44	United Kingdom
San Francisco	2	74.41	United States of America
Boston	3	73.57	United States of America
Paris	4	72.60	France
New York	5	71.81	United States of America
Copenhagen	6	71.72	Denmark
Zurich	7	71.28	Switzerland
Stockholm	8	71.10	Sweden
Singapore	9	70.80	Singapore
Seoul	10	69.98	Republic of Korea
Helsinki	11	69.53	Finland
Tokyo	12	69.45	Japan
Berlin	13	69.41	Germany
Hong Kong	14	68.93	Hong Kong SAR (China)
Geneva	15	68.09	Switzerland
Toronto	16	66.21	Canada
Oslo	17	65.53	Norway
Los Angeles	18	65.30	United States of America
Dublin	19	65.20	Ireland
Montreal	20	64.40	Canada
Washington, DC	21	64.28	United States of America
Melbourne	22	63.72	Australia
Sydney	23	63.04	Australia
Vienna	24	62.36	Austria
Frankfurt	25	61.85	Germany
Rotterdam	26	61.75	Netherlands
Barcelona	27	61.61	Spain
Osaka	28	61.22	Japan
Brussels	29	61.16	Belgium
Auckland	30	60.67	New Zealand
Madrid	31	60.23	Spain
Chicago	32	60.20	United States of America
Lyon	33	59.28	France
Tel Aviv	34	59.10	Israel

Islamabad	99	23.32	Pakistan
Addis Ababa	100	23.03	Ethiopia
Harare	101	22.53	Zimbabwe
Abuja	102	22.41	Nigeria

A closer look at the Top-10 cities

Because they are the champions of this first edition of CFRI, the top-ten cities deserve deeper consideration. Each of them has specific strengths. It is also interesting to note that they sometimes have adopted different ways to address similar problems.

1. London ranks as the world's most future-ready city, reflecting its exceptional breadth of strengths across economic, technological, and cultural dimensions. It stands out globally for Vibrancy (1st), driven by world-class performance in financial activity (3rd) and cultural assets (2nd), confirming its status as a truly global hub. It is likewise a global leader in Openness (1st), combining unrivalled investment appeal (1st) with a relatively competitive talent pool (21st). London also excels in Sustainability (2nd), buoyed by strong urban design (5th), and performs impressively in e-readiness (6th), supported by its AI readiness (8th). Yet some foundations are less robust: digital infrastructure (51st) drags down performance and Innovation (23rd) is weaker than expected for a city of its scale. Overall, London's mix of economic dynamism, cultural depth, and institutional strength secures its position as the world's most future-ready city.

2. San Francisco ranks as the world's second most future-ready city, powered by exceptional strengths in outputs. It leads globally in Innovation, driven by cutting-edge intellectual property activity (1st) and unmatched R&D intensity (3rd). The city is also the undisputed leader in e-readiness, excelling in

both data readiness (2nd) and AI readiness (2nd). Its Vibrancy (4th) is equally striking, with top-tier results in financial activity (2nd) and cultural dynamism (4th), which underlines its role as a hub for both business and creativity. These strengths place San Francisco at the forefront of shaping the digital and innovation-driven world economy. Yet its input side tells a different story. The city lags significantly in People Centricity (48th), reflecting challenges in liveability (55th) and access to services (58th). Weaknesses in transport mobility (44th) and sustainability (46th) further weigh on its long-term resilience. Overall, San Francisco stands as a global benchmark for innovation and digital leadership, driving the technologies and ideas that define the future.

3. Boston makes it into the top-3 on the back of its unique blend of academic excellence and technological strength. At the heart of its performance is Innovation (2nd), where it leads globally in R&D intensity and is a top performer in intellectual property creation (3rd). This mirrors the city's role as a powerhouse of research universities, teaching hospitals, and cutting-edge startups. Boston is also a frontrunner in e-readiness (2nd), topping the world in AI readiness and drawing on a well-developed digital ecosystem. These capabilities are complemented by high levels of Openness (16th) and Vibrancy (17th) boosted by the skills of the population and strong financial networks. Yet the city is not without its vulnerabilities: safety concerns dampen liveability (30th) and mobility (32nd), while sustainability (18th) could weigh on long-term resilience. Even so, Boston's ability to turn ideas into impact—supported by its deep research culture—cements its place among the world's innovation leaders.

4. Paris has a clear advantage in the output-related dimensions. Above all, it excels in Vibrancy (3rd), standing out as the global leader in cultural vitality and maintaining a strong position in financial activity (7th). Paris also ranks highly in e-readiness (7th), supported by advanced data readiness (7th) and AI readiness (11th). Its Innovation (14th) pillar is underpinned by robust R&D intensity (10th) and active intellectual property creation (15th). As for the input side, Openness (6th) remains a major asset, reinforced by Paris's continued attraction for foreign investment (4th). However, the city's performance is more modest in Sustainability (22nd) and in Institutions & Governance (33rd). Overall, Paris combines strong cultural, financial, and technological assets that reinforce its position among the world's most globally connected cities.

5. New York is powered by its formidable output strengths. The city shines in Vibrancy (2nd), where it leads globally in financial activity and ranks among the very best for cultural vitality (3rd). It also performs strongly in e-readiness (5th), supported by world-class data readiness (2nd) and a robust AI ecosystem (10th). These results reaffirm New York's position as a global powerhouse for both finance and technology. Its innovation record (21st), however, is less impressive than its scale might suggest, reflecting solid R&D (23rd) and intellectual property (18th) activity. On the input side, the city's role as a financial centre results in drives high Openness (5th), especially towards foreign investment (2nd). However, weaknesses in People Centricity (46th)—linked to low liveability (48th)—and in Transport & Infrastructure (25th)—hampered by traffic congestion and weak mobility (46th)—remain key challenges. In sum, New York thrives as a centre of economic and digital power, reinforcing its status as a global economic and technological leader.

6. Copenhagen leads the world in the index's input dimensions, reflecting its reputation for effective governance, sustainability, and high quality of life. The city excels in Institutions & Governance (2nd), as a result of superior government effectiveness, strong rule of law, and low corruption. Copenhagen also enjoys excellent Sustainability (4th) and Transport & Infrastructure (5th)—the former boosted by clean air and abundant green areas and open public spaces, the latter by high mobility (8th) and quality digital infrastructure (8th). The city's Innovation (10th) capacity, driven by substantial R&D spending, and its strong cultural vibrancy (10th) further contribute to its competitive profile. That said, some areas leave room for growth. Openness (24th) is held back by relatively modest investment (39th) and talent competitiveness (22nd). Overall, Copenhagen combines world-class governance and liveability with a technologically advanced society and economy.

7. Zurich has broad-based strengths, with particularly strong results in Institutions & Governance (4th) and Transport & Infrastructure (4th), thanks to excellent governance (3rd), high-quality institutions (5th), and world-class mobility (2nd). The city also stands out for its People Centricity (10th), as its inhabitants enjoy high liveability (7th) and good access to services (15th). Zurich's position as a research and technology hub is reflected in impressive Innovation (9th) outcomes, supported by world-class universities and scientific breakthroughs. It is further mirrored in its e-readiness (8th), which is bolstered by AI Readiness (5th), although local online public services could be further enhanced. Another weaker point relates to Sustainability (29th), where greater access to open public spaces would strengthen performance in urban design (45th). Overall, Zurich blends institutional excellence and innovation-driven growth with an enviable quality of life.

8. Stockholm stands out for its strong fundamentals and sustainability leadership. In fact, it tops the global rankings in Sustainability, excelling in energy and waste management (2nd) and urban design (1st) that prioritises clean air and green spaces. Stockholm also performs strongly in Institutions & Governance (8th), marked by effective government and low corruption, and in Transport & Infrastructure (7th), where both mobility and digital infrastructure rank among the global top 10. The city's digital strength is reinforced by high AI readiness (4th), which lifts its e-readiness (9th). Stockholm also demonstrates a strong Innovation (15th) capacity in science and technology and a high liveability (4th), which further cement the city's reputation as one of Europe's most attractive places to live and work. However, Openness (20th) remains a relative weakness, constrained by modest investment (40th). Overall, Stockholm pairs environmental excellence and digital strength with social trust and high quality of life.

9. Singapore showcases exemplary governance, openness to global enterprise, and advanced infrastructure. It leads the world in Institutions & Governance, combining top-ranked institutions (1st) with effective governance (2nd). The city-state also excels in Openness (3rd), thanks to its ability to attract foreign business and investment (3rd) and its continued pull as a global talent magnet (12th). Its Transport & Infrastructure (6th) system is another hallmark of efficiency, pairing reliable mobility (11th) and world-class digital infrastructure (4th). Singapore's

global connectivity and innovation ecosystem underpin its Vibrancy (6th), reflected in the dynamism of its financial (11th) and cultural (9th) sectors. It also performs well in Innovation (19th), with strong R&D intensity (12th) and high-performing universities. Yet even this highly liveable city (2nd) faces challenges in access to services (56th) and Sustainability (60th), particularly in lowering emissions. Overall, Singapore remains a model of smart, well-governed development striving for greater environmental and social balance.

10. Seoul combines technological sophistication with a strong people-centred orientation. Its standout performance in People Centricity (4th) highlights the city's emphasis on access to services (2nd) and citizen well-being—an achievement that few megacities of comparable scale can match. Seoul is also a top performer in Innovation (3rd), with one of the world's highest shares of R&D spending, contributing to leading R&D intensity (2nd) and intellectual property intensity (6th). The city's robust digital infrastructure (11th) translates into an E-readiness (12th) capacity built on advanced data readiness (6th) and a fast-developing AI ecosystem (20th). However, despite its digital and research excellence, Seoul's Institutional & Governance (31st) frameworks and environmental Sustainability (47th) leave room for improvement, including better air quality and greater access to open public spaces. Overall, Seoul stands out as a people-focused innovation hub - one that successfully blends technological vitality with a commitment to improving urban quality of life.

Other notable cities

Every city (whether or not it is covered by CFRI) has its own interesting history and narrative. Among the 102 cities listed in this edition of CFRI, another 15 deserve particular attention, because of their particular role in a country, region, or income group.

12. Tokyo remains one of the world's foremost innovation powerhouses, blending technological depth with global reach and institutional strength. The city's standing in Innovation (4th) is driven by exceptional intellectual property creation (2nd) and strong R&D intensity (6th), confirming its position at the cutting edge of science and technology. Tokyo also performs strongly in Openness (2nd), attracting global investment (7th) and leading the world in talent competitiveness. Its Vibrancy (9th) reflects the city's enduring importance as both a financial (9th) and cultural (12th) centre. Yet while Tokyo excels in innovation, it is less of a frontrunner in the digital age: sub-par digital infrastructure (53rd) and modest E-readiness (33rd) suggest that more could be done to accelerate digital transformation. Still, with its combination of research strength, institutional reliability, and human capital, Tokyo stands as a dynamic, knowledge-driven metropolis continuing to shape the future of global innovation.

14. Hong Kong combines exceptional liveability with strong economic and institutional performance. It ranks first globally in People Centricity, reflecting outstanding liveability (1st) and excellent access to services (3rd)—a rare achievement for a dense global city. Its Openness (9th) remains a core asset, driven by high investment openness (6th) and solid integration into global capital flows. Hong Kong also performs well in Innovation (8th), underpinned by active intellectual property creation (7th) and world-class universities. Its Vibrancy (10th) mirrors its reputation as an international business and cultural hub, supported by dynamic financial (12th) and cultural (11th) sectors. Meanwhile, efficient transport and digital infrastructure (13th) adds to its competitiveness. However, weaker Sustainability (41st) and lacklustre E-readiness (48th) indicate scope to enhance environmental resilience and digital capability. Overall, Hong Kong combines world-class liveability and openness with a vibrant, innovation-driven economy at the heart of Asia.

16. Toronto stands out for its balance of openness, institutional strength, and growing digital capabilities. The city performs strongly in Openness (10th), reflecting its global competitiveness in talent (9th) and investment openness (13th). Its Institutions & Governance (13th) are a source of stability, supported by high regulatory quality, strong government effectiveness, and low levels of corruption. Toronto shows a clear strength in the digital economy, with E-readiness (13th) bolstered by excellent data readiness (9th) and solid AI readiness (18th). It also achieves respectable results in Vibrancy (20th), which can be primarily traced to positive financial activity (16th) in the startup scene and international firm networks. However, weaker outcomes in People Centricity (35th)—including liveability (32nd) and access to services (42nd)—and low energy and waste performance (69th) weigh on its sustainability. Overall, Toronto combines institutional stability, digital readiness, and openness to global talent, reinforcing its status as an internationally connected and forward-looking city.

22. Melbourne ranks high on institutional strength and cultural vibrancy. It performs particularly well in Institutions & Governance (10th), marked by rule of law, high regulatory quality, and low levels of corruption. The city also delivers solid results in Vibrancy (15th), supported by rich cultural activity (14th) and a diverse creative economy. Openness (18th) remains another strength, driven by high talent competitiveness (19th) and strong international connectivity. Melbourne's Innovation (28th) pillar is sustained by solid R&D intensity (21st) and intellectual property intensity (34th), backed by world-class universities. Although Melbourne exhibits a strength in AI Readiness (22th), its sub-par performances in Data Readiness (63rd) and Digital Infrastructure (61st) signal areas for improvement in the city's digital maturity. Overall, Melbourne's combination of effective governance, cultural vitality, and innovation capacity continues to underpin its future readiness.

23. Sydney makes it into the top quarter of the index, propelled by robust institutions and an outward-looking economy. The city performs particularly well in Institutions & Governance (10th) and Openness (11th), where the latter pillar is boosted by openness to investment (14th) and talent competitiveness (20th). Sydney's attraction as an investment destination is further manifested in vibrant financial activities (15th). It also performs well in E-readiness (17th), buoyed by its engagement in data readiness (12th) and solid AI readiness (27th), notwithstanding the city's lacklustre digital infrastructure (62nd). The main challenge for Sydney, however, is to improve Sustainability (67th), including reducing greenhouse gas emissions. With its open economy, strong institutions, and growing digital edge, Sydney remains one of the region's most dynamic cities.

34. Tel Aviv is the best-performing city in the Middle East, standing out for its innovative capacity and digital sophistication. The city's strength in Innovation (17th) is powered by robust R&D intensity (11th) and active intellectual property creation (21st)—a reflection of high R&D spending and strong ties between academia and industry. Tel Aviv also fares well in E-readiness (28th), where its impressive output of AI patents contribute to solid AI readiness (26th). The buzzing start-up scene boosts financial activity (28th) and, by extension, the city's Vibrancy (39th), while its talent competitiveness (25th)—driven by a highly skilled workforce—further lifts Openness (30th). Although Energy and Waste management (6th) supports overall Sustainability (50th) score, there is scope to improve urban design (73rd), including by expanding green areas and open public spaces. Overall, Tel Aviv's innovation and digital strengths underpin its role as one of the foremost urban centres in the Middle East.

35. Beijing is the highest-ranked Chinese city in the index, reflecting its position as one of the world's foremost innovation powerhouses. It has a clear advantage in the output-related pillars, performing exceptionally well in Innovation (5th), as its leading universities, major research institutes, and technology-driven industries contribute to strong intellectual property creation (5th) and substantial R&D intensity (9th). Beijing also excels in Vibrancy (13th) and shows solid E-readiness (30th), with the former pillar driven

by high financial activity (4th)—including a dynamic startup scene—and the latter pillar supported by AI readiness (21st) rooted in extensive software development and AI-related innovation. Among the input-related pillars, Beijing benefits from strong digital infrastructure (7th), although its Transport & Infrastructure (35th) pillar is constrained by weak mobility (61st), including access to public transport. There is also scope to improve Sustainability (61st) through better air quality and lower greenhouse gas emissions. Despite these gaps, Beijing's scale, research intensity, and technological dynamism make it one of the global centres of innovation and digital transformation.

40. Dubai ranks among the world's most open and well-connected cities, combining global reach with world-class infrastructure. It performs exceptionally well in Openness (4th), reflecting strong investment openness (5th)—Dubai is the world's top destination for greenfield FDI—and an ability to attract international talent (16th). The city also excels in Transport & Infrastructure (2nd), supported by excellent digital infrastructure (2nd) and efficient mobility systems (13th). Vibrancy (12th) further adds to its future readiness, driven primarily by high cultural activity (8th) and a burgeoning startup scene. Performance is weaker in Innovation (67th), where challenges include converting strong inputs into greater R&D output and higher science and technology intensity. Further progress is also needed in Sustainability (94th), notably by expanding green areas and reducing greenhouse gas emissions. Overall, Dubai remains an important centre for connectivity and exchange, underpinned by its openness, advanced infrastructure, and cultural and financial vitality.

43. Shanghai is a leading centre of innovation and finance. With respect to Innovation (12th), it hosts one of the world's main science and technology clusters - which contribute to high intellectual property intensity (10th) - and enjoys strong R&D intensity (15th). The city's Vibrancy (14th) is equally impressive, mainly driven by financial activities (5th) marked by a dynamic startup ecosystem and extensive international networks. The global aspect of Shanghai is further reflected in its appeal as an investment destination (12th), which is a key factor behind its Openness (28th). On the digital side, Shanghai benefits from excellent digital

infrastructure (5th), which contributes to its E-readiness (45th). However, Sustainability (79th) remain a key area for improvement, where further efforts could be made to improve air quality, expand access to open public spaces, and lower greenhouse gas emissions. Despite these gaps, Shanghai's blend of innovative capacity, financial strength, and global connectivity places it in a strong position to further its future readiness.

44. Abu Dhabi's future readiness rests on the strength of its infrastructure, openness, and governance. The city is the global leader in digital infrastructure (1st), making it a top-10 performer in Transport & Infrastructure (8th) despite sub-par mobility (58th). Openness (12th) is another defining strength, reflecting its strong investment appeal (15th) and ability to attract international talent (16th). The Institutions & Governance (35th) pillar is underpinned by effective government and a solid institutional framework. Abu Dhabi also performs well in E-readiness (38th), where advanced local online services and strong engagement in data management drive data readiness (16th). Sustainability (92nd) remains a key challenge, where improving air quality and expanding green areas would strengthen urban design (84th). Although Innovation (54th) points to untapped R&D potential, Abu Dhabi's emphasis on digital infrastructure and global openness provides a durable foundation for greater economic and environmental resilience.

54. Santiago stands out as Latin America's highest-ranked city in the index, reflecting a solid balance across most dimensions of future readiness. The city performs particularly well in Sustainability (40th) and Institutions & Governance (41st). In the former, extensive access to open public spaces supports urban design (54th), while the latter is underpinned by consistent public administration and a reliable regulatory environment. Santiago also ranks in the upper half in the People Centricity (47th) pillar, reflecting good schooling and high life expectancy. Its weakest pillar, E-readiness (78th), points to the need for stronger data readiness (79th) and AI readiness (68th). There is also scope to improve Openness (66th) by attracting more foreign investment and addressing unemployment, particularly among young people. Santiago's combination of environmental strength and institutional stability provides a solid platform for advancing its future readiness.

55. Sao Paulo ranks as one of Latin America's most technologically advanced and economically dynamic cities. It performs particularly well in E-readiness (24th), supported by world-leading data readiness (1st). The city's Vibrancy (30th) pillar is another strength, driven by high levels of financial activity (23rd) and supported by a dynamic startup scene and strong networks of international firms. Sao Paulo also performs respectably in Sustainability (52nd), Transport & Infrastructure (53rd), and Innovation (53rd), where highlights include good digital infrastructure (23rd), solid energy and waste management, and strong universities. Institutions & Governance (83rd) remains a major constraint, with weak results in both institutions (78th) and governance (85th), alongside challenges in People Centricity (73rd) where reducing crime and strengthening health and education should be priorities. Overall, Sao Paulo's future readiness primarily reflects a mix of strong digital capabilities and a vibrant urban economy.

69. Bengaluru is the top-performing Indian city in the index. Above all, the city shines in the output-related pillars, although its strongest performance is in Openness (46th), supported by a high level of investment openness (9th) reflected in considerable foreign investment. Among the outputs, Bengaluru achieves its highest rank in Innovation (52nd), with strong universities and a vibrant science and technology base contributing to robust intellectual property activity (49th) and extensive R&D activity (55th). In Vibrancy (54th), it shows solid financial activity (30th), underpinned by a dynamic startup scene and international firm linkages. In E-readiness (57th), the city's strengths in software development and digital patents bolster AI readiness (34th), notwithstanding sub-par digital infrastructure (75th). Bengaluru's main challenge lies in People Centricity (99th), where low liveability (96th) and limited access to services (94th) constrain its future readiness. Bengaluru primarily benefits from its entrepreneurial and digital strengths, which provide a foundation for greater innovation-led growth and urban development.

73. Cape Town is the highest-ranked city in Sub-Saharan Africa. The city makes it into the upper half in one pillar—Vibrancy (45th)—mainly due to strong cultural activity (35th), including a buzzing restaurant scene, and financial activity (58th) linked to international business connections. Sustainability (59th) is another area of relative strength, driven by effective energy and waste management (44th) and urban design (69th) marked by good air quality and access to open public spaces. Cape Town performs well in access to services (23rd) under People Centricity (79th), although low liveability (97th) highlights persistent socio-economic divides and safety concerns. The main area for improvement is Openness (86th), where relatively strong investment attractiveness (44th) is offset by high unemployment—especially among young people—which hampers talent competitiveness (99th). Another priority is to raise download speeds to strengthen digital infrastructure (83rd). Despite these constraints, Cape Town's cultural vitality and international connections provide a foundation for improving its future readiness.

82. Kigali is the best-performing city in the index located in a low-income country. The city's strongest area is Institutions & Governance (50th), supported by solid rule of law, effective government, and comparatively low levels of corruption. Sustainability (65th) is another area of relative strength, with urban design (57th) characterised by good access to open public spaces and energy and waste management (72nd) marked by low greenhouse gas emissions. Among the output-related pillars, Kigali achieves its highest rank in E-readiness (76th), as local online services and engagement in data initiatives enhance its data readiness (70th). Across the remaining pillars, the city ranks below 90. A key challenge is to improve People Centricity (93rd), primarily constrained by limited access to health and educational services (96th). Another priority is to raise Openness (91st) by boosting investment appeal (85th), tackling unemployment, and strengthening skills to increase talent competitiveness (92nd). While challenges remain, Kigali's institutional reliability and sustainability efforts signal meaningful steps towards greater future readiness.

Aerial View of Shanghai overpass at night @fanjianhua

Key message 1 – Cities can be future ready in different ways - lessons can be learned and adapted from the champions.

Out of the 'top-ten' cities, 5 stand out as cities whose key strengths can be found on the 'output' side of the CFRI model (innovation, vibrancy and e-readiness): they are indeed the top-5 of this year's ranking: London, San Francisco, Boston, Paris and New York. The next 4 (Copenhagen, Zurich, Stockholm and Singapore) perform high in one or several pillars of the 'input' side of the model (e.g. human centricity, sustainability). Seoul is somewhat a special case, as it belongs to the first category (high on output) but also to the second one (high on human centricity).

Key message 2 – Cities with large populations face bigger problems, but some of them are better equipped to face them – this generates a 'metropolis paradox'.

It is remarkable that among the CFRI top-ten, cities with larger populations (above 5 million) seem to be stronger on output than on input (exception of Seoul again). Diseconomies of scale clearly emphasize the severity of environmental, safety and mobility issues in large cities. Rich cities however, even when they have multi-million populations, tend to be able to partly offset such handicaps through the adoption of smart services and management methods.

Key message 3 – If strong and coordinated action is not taken, the 'urban divide' could rapidly grow to alarming proportions – heavily populated poorer countries would be the first ones to suffer.

Out of the 3 billion new residents that the world will need to house in cities by 2050, two thirds will be living in developing and emerging economies. Insufficient levels of locally available financial and technological resources would lead to a momentous broadening of the urban divide. In those countries, large metropolises would tend to concentrate poverty and dysfunctions of all kinds.

Key message 4 – Technological innovation can help accelerate progress in key areas of urban design and management - in particular through the deployment of AI at city level.

At city level, a properly managed use of artificial intelligence could improve energy consumption patterns, mobility strategies, waste management, for example, as well as the overall quality of municipal management and governance. With adequate international and inter-city cooperation, such positive developments could be brought to the benefit of all, including through the dissemination of traditional eco-friendly urban and architectural design.

Key message 5 – The competitiveness of cities is being redefined, for example as financial centres, as innovation clusters, as transport hubs (either for supply chains or for tourism). Branding and visibility have become priorities for any city aspiring to an international role.

The relative retreat of certain nation states from their traditional multilateral responsibilities and commitments have led many cities to build their own networks of cooperation. Such cooperation includes a significant component of competition (for trade, investments and talent for example). In this new co-opetition environment, and against the background of rapid changes and increased volatility, the competitiveness of cities is taking new shapes, depending on their strategic positioning (for example as financial centres, as innovation clusters, or as transport hubs, either for supply chains or for tourism). Branding and visibility have become priorities for any city aspiring to an international role.

Key message 6 – Talent attraction is key to cities' future readiness – brain drain and brain gain need to be revisited through the lens of brain circulation.

In addition to the handful of cities that have enjoyed a strong reputation as 'university towns' (sometimes for centuries), new talent hubs are emerging in the 'global south' either because established universities have opened campuses there, or because local academic institutions have acquired a reputation and record of their own. New 'talent magnets' have also emerged in many parts of the world, especially in cities that can offer a combination of quality of life and high-quality information infrastructure. In this regard, COVID has accelerated the attractiveness of medium-size cities, especially in Nordic countries and Switzerland, for example. Cities who aim at attracting high-level talents have also realized that high-level salaries is somehow less important than offering such talents opportunities to collaborate with other talents (critical mass) and to acquire new knowledge and experience (brain circulation).

Key message 7 – Cities are building new comparative advantages – those are mainly based on history, culture and experience.

In developing their own individual strategies to be more competitive and future-ready, cities have realized that the most durable comparative advantages are the ones that cannot be easily replicated. In such a context, history and culture take a particular value: highlighting local heritage (in particular in architecture, but also in traditions and values), hosting high-quality museums and cultural events have become areas of primary interest for cities. It is not a paradox for cities to consider that being future ready can go hand-in-hand with respecting and heralding their past.

A closer look at CFRI data, & a few policy implications

While some of these key messages result directly from the data gathered for this year's report, some are the result of observations of the experience and strategies of specific cities or categories of cities.

From the point of view of data, it is important to consider how the two sides of the CFRI model (inputs vs outputs) correlate with one another. The diagram below shows how well cities perform across the Input-related and Output-related dimensions of the index. Each city's performance is represented by its rank in the two dimensions, with Input ranks on the x-axis and Output ranks on the y-axis. Overall, the two dimensions are strongly and positively correlated (0.84), as cities that perform well in one tend to perform well in the other. However, further analysis that takes into account city population size reveals some interesting patterns.

Does size matter ?

Figure 4: Input vs Output ranks and population size

The statistical analysis of data shows weak and negative correlation between input pillars and city size, but a weak and positive correlation between output pillars and city size. This suggests that critical mass matters for achieving results. However, there is (as always) a story behind that story.

On the diagram above, two regression lines have been added to the scatter plot: the red one for cities above 5 million inhabitants, and the blue one for cities below 5 million. Unsurprisingly, both lines show a strong positive correlation between inputs (first 5 pillars of the CFRI model : POSIT) and outputs (last 3 pillars: IVE). However the first line is clearly above the second one, showing that, for a particular level of input, larger cities are benefitting from a significantly higher performance on outputs. This phenomenon could be described as 'output amplification': large cities like San Francisco and Boston in the US or Beijing, Shanghai and Shenzhen in China are "output amplifiers" in that they manage to transform some critically (although often overlooked or under-measured) inputs into impressive outputs. This observation confirms that sheer scale does not guarantee future readiness overall, but it does appear to turbocharge outputs — big cities harness critical mass to generate innovation and vibrancy, even if their input foundations are uneven.

Does wealth matter ?

Figure 5: CRFI score vs income level

As expected, there is a strong and positive correlation between CFRI performance and GDP per capita. This can also be seen in the top-10 and bottom-10 ranks, which underlines a strong geographic and income divide. In other words: rich cities are more future ready, which could lead to widening the gap between advanced cities on one hand and heavily populated poorer cities on the other.

Why the urban divide could grow, and what to do about it

Diseconomies of scale affect all cities, rich and poor. For example, when population grows, one could intuitively expect that traffic congestions will increase in frequency and intensity, and that criminality will also be on the rise. Air quality would also be a candidate for deterioration. This is confirmed by CFRI data: for example, taking into account all of CFRI's 102 cities, a negative correlation appears between city population and the three variables describing air quality, share of green areas, and access of open public spaces. Yet, the correlation becomes positive (and stronger) if one compares cities' wealth (GDP per capita) to the combination of those same three variables (grouped under the 'urban design' sub-pillar). The same is true (with an even higher level of negative correlation) of the relation between population size and mobility. In other words, larger cities do worse in terms of sustainability, but richer cities do significantly better than poorer cities in that respect.

Here appears the 'metropolis paradox', in part due to the availability of smart technologies (e.g. saving energy, rationalizing traffic) in richer municipalities. Seen from that angle, the case of heavily populated (metropolises) in poorer countries (in particular in Africa) immediately strikes attention as combining all the elements of an imminent crisis.

Recent experience has shown that a number of emerging economies have come to grips with this situation. An 'ideal approach' to solving housing and other key dimensions of urbanization in poorer economies has yet to emerge. Recent decades showed the limits of rapid real-estate driven urban growth (such as in Chinese 'phantom cities') while attempts to create new cities (Neom, Nusantara eg) have yet to gather momentum.

But for many large urban centres in the 'global south', diseconomies of scale are of a different order, as they often include an important component of poverty aggregation. In many of those cities, a massive influx of population results from a combination of demographic growth and rural-urban migration. As the population increases, its average income decreases. In many parts of the 'global south', this spiral of poverty is creating massive problems (sometimes amplified by climate-related issues), generally characterized by insufficient infrastructure (transport, communications, water, energy and waste management in particular).

Action is urgently required to address this problem before a point of no return is reached:

- City leaders need to adopt future-looking strategies to attract the investment required to upgrade existing critical infrastructure; one condition of success in this area is good governance
- National authorities have to consider 'harmonious urbanization' as a key ingredient in their medium-long term strategies (along the lines of 'inclusive prosperity')
- International cooperation must be mobilized (and financed) to heighten collective awareness around the importance of urban policies for global sustainability and equity.

At all those levels, discussions and actions can benefit from better metrics. This is where CFRI hopes to be useful.

SECTION TWO
City
Profiles

How to Read the City Profiles

The city profiles provide more granular information on how each of the 102 cities performs in the various dimensions of the Cities Future Readiness Index (CFRI).

Each city profile consists of two pages. The first page presents a city's key indicators and a visual overview of its CFRI performance in the eight pillars. The second page presents detailed information on a city's performance across all pillars, sub-pillars, and indicators.

1

Abidjan

Key Indicators

Rank (out of 102)	98	Country	Côte d'Ivoire
CFRI Score	23.75	Regional group	Sub-Saharan Africa
Population (millions)	5.90	Income group	Lower-middle income
GDP per capita (PPP US\$)	10,899		

2

The first page includes two specific parts:

1 Key indicators

Each city profile begins with a summary of key indicators. Most prominently, the city's rank within the CFRI (out of 102 cities) is presented alongside its overall CFRI score, as well as basic statistics on population and GDP per capita. The summary also identifies the country to which the city belongs and indicates its corresponding income and regional group classifications.¹

2 Radar chart

The visualisation on the first page is a radar chart illustrating the city's performance across the eight pillars of the CFRI. Pillar names and corresponding scores appear along the outer rim. The pillar scores are also represented graphically by buildings—one for each pillar—where taller buildings indicate higher scores. The city's overall CFRI rank is displayed at the centre of the chart, in the bull's-eye.

The results on the second page present a city's normalised scores and ranks across all pillars, sub-pillars, and indicators. Pillars are denoted by a bold single-digit code (e.g., 1 People Centricity), the sub-pillars by a two-digit code (e.g., 1.2 Access to Services), and the 44 indicators by a three-digit code (e.g., 1.2.3 Mean years of schooling).

¹The income group is based on the World Bank's Income Group Classification as of July 2025.

CFRI 2025 coverage

Abidjan	32	Dubai	102	Nanjing	172
Abu Dhabi	34	Dublin	104	New York	174
Abuja	36	Frankfurt	106	Osaka	176
Accra	38	Geneva	108	Oslo	178
Addis Ababa	40	Hanoi	110	Paris	180
Almaty	42	Harare	112	Prague	182
Ankara	44	Helsinki	114	Rabat	184
Asuncion	46	Hong Kong	116	Rio de Janeiro	186

1 PEOPLE CENTRICITY

1.1 LIVEABILITY

1.1.1 GENDER DEVELOPMENT EQUALITY

Gender development equality | 2022

Gender development equality refers to the parity of human development between women and men. For each gender, a separate Human Development Index (HDI) has been constructed, based on indicators in three different dimensions: education, health, and standard of living. The ratio of the female HDI over the male version yields Gender Development Index (GDI). A value below 1 indicates a male advantage, a value above 1 indicates a female advantage, and a value of 1 implies perfect equality. The index values are adjusted following the methodology of the UN Educational, Scientific and Cultural Organization (UNESCO) to ensure that 1 (i.e. perfect equality) is the maximum value, while any form of gender inequality is reflected in values below 1.

Source: Sub-national data retrieved from the *Subnational HDI Database* of the Global Data Lab, version v7.0 (<https://globaldatalab.org/shdi/>); Smits, J. and Permanyer, I. *The Subnational Human Development Database* Sci. Data. 6:190038 <https://doi.org/10.1038/sdata.2019.38> (2019). National data retrieved from the *Gender Development Index*, UN Development Programme (UNDP).

1.1.2 LIFE EXPECTANCY

Life expectancy at birth | 2024

Life expectancy relates to the estimated number of years that a newborn is expected to live conditional on age, sex, and location at the time of birth. Most data are sub-national estimates taken from either OECD or Global Data Lab.

Source: OECD (2024), *OECD Regional Statistics (database)*, OECD, Paris (<http://oe.cd/geostats>); Global Data Lab, *Subnational HDI Database*, version v7.0 (<https://globaldatalab.org/shdi/>); Smits, J. and Permanyer, I. *The Subnational Human Development Database*. Sci. Data. 6:190038 <https://doi.org/10.1038/sdata.2019.38> (2019). Data for Taipei City are proxied by national estimates that have been retrieved from the Ministry of Interior, Taiwan, <https://www.moi.gov.tw/english/cl.aspx?n=7779>.

1.1.3 SAFETY

Homicides rate (per 100,000 people) | 2019

The rate of homicide refers to the number of people out of 100,000 population killed in a given calendar year. A homicide is defined as an intentional act of killing, and therefore excludes deaths resulting from recklessness or negligence.

Source: Eurostat and OECD, taken from *OECD Regions, cities and local areas database* (<http://oe.cd/geostats>); UN-Habitat (<https://data.unhabitat.org/>); United Nations Office on Drugs and Crime (UNODC, <https://dataunodc.un.org/dp-intentional-homicide-city>); World Health Organization, Global Health Observatory (<https://www.who.int/data/gho>). Data for Abuja are vfrom Ukoji, Ayodokun and Eze (2019) *Nigeria Watch Report on violence in Nigeria*.

1.2 ACCESS TO SERVICES

1.2.1 HOSPITAL BED DENSITY

Hospital beds (per 10,000 people) | 2024

Hospital bed density refers to the number of hospital beds available per 10,000 people.

Source: OECD (2024), *OECD Regional Statistics (database)*, OECD, Paris (<http://oe.cd/geostats>). The values for some cities are proxied by national estimates retrieved from World Health Organization, Global Health Observatory; (<https://www.who.int/data/gho>). Data for Hong Kong and Taipei City are taken from, respectively, the Health Bureau (https://www.healthbureau.gov.hk/statistics/en/health_statistics.htm) and the Ministry of Health and Welfare (<https://www.mohw.gov.tw/cp-7155-79484-2.html>).

1.2.2 EXPECTED YEARS OF SCHOOLING

Expected years of schooling | 2022

School life expectancy is the number of years that a child is expected to receive primary, secondary, and tertiary education. It is computed by summing 'the age specific enrolment rates for the levels of education specified'. As per the methodology of the Human Development Index (HDI) by the United Nations Development Programme (UNDP), the minimum value is set at 0 and the maximum value is set at 18.

Source: Sub-national data retrieved from the *Subnational HDI Database* of the Global Data Lab, version v7.0 (<https://globaldatalab.org/shdi/>); Smits, J. and Permanyer, I. *The Subnational Human Development Database*. Sci. Data. 6:190038 <https://doi.org/10.1038/sdata.2019.38> (2019). Data for Hong Kong and Taipei City are taken from, respectively, *World Development Indicators* of the World Bank (<http://data.worldbank.org/data-catalog/world-development-indicators>) and the Ministry of Education (<https://english.moe.gov.tw/np-76-1.html>).

1.2.3 MEAN YEARS OF SCHOOLING

Mean years of schooling | 2020

This indicator refers to the average number of years of schooling completed by the population aged 25 years and above. As per the methodology of the Human Development Index (HDI) by the United Nations Development Programme (UNDP), the minimum value is set at 0 and the maximum value is set at 15.

Source: Sub-national data retrieved from the *Subnational HDI Database* of the Global Data Lab, version v7.0 (<https://globaldatalab.org/shdi/>); Smits, J. and Permanyer, I. *The Subnational Human Development Database*. Sci. Data. 6:190038 <https://doi.org/10.1038/sdata.2019.38> (2019).

2 OPENNESS

2.1 INVESTMENT OPENNESS

2.1.1 HEADQUARTER PRESENCE

Prevalence of Forbes' Global 2000 headquarters | 2022

Headquarters presence captures how many major firms are based in a city. Specifically, it counts the number of public companies included in the Forbes' Global 2000 list that have their headquarters in a given city.

Source: Forbes' Global 2000 (<https://www.forbes.com/lists/global2000/>).

2.1.2 FDI PROJECTS

Number of FDI projects | 2024

The number of FDI projects refers to the sum of inward greenfield investment projects that a city attracted during the three-year period 2022-2024.

Source: © fDi Markets, from the Financial Times Ltd 2025.

2.1.3 FDI JOBS CREATED

Number of jobs created by FDI (per 1 million population) | 2024

This indicator is based on estimated values on jobs created as a result of inward greenfield investment projects that a city attracted during the three-year period 2022-2024. The number of jobs are weighted by population and values are expressed as per million population.

Source: © fDi Markets, from the Financial Times Ltd 2025.

2.2 TALENT COMPETITIVENESS

2.2.1 LABOUR PARTICIPATION

Labour force participation rate (% of population) | 2024

Labour participation refers to the rate of participation in the labour market for people aged 15-64 years, expressed as a percentage of the total population of the same age group. OECD data are at the FUA or region level; ILO data are national estimates for urban areas.

Source: OECD Regions, cities and local areas database (<http://oe.cd/geostats>) and International Labour Organization, ILOSTAT (<https://ilostat ilo.org/>)

2.2.2 UNEMPLOYMENT

Unemployment rate (% of labour force) | 2024

Unemployment rate refers to the percentage of the labour force who are unemployed. The labour force covers the population aged 15-64 years. OECD data are at the FUA or region level; ILO data are national estimates for urban areas.

Source: OECD Regions, cities and local areas database (<http://oe.cd/geostats>) and International Labour Organization, ILOSTAT (<https://ilostat ilo.org/>).

2.2.3 YOUTH INCLUSION

Proportion of youth (aged 18–24 years) not in education, employment or training (%) | 2020

This indicator refers to the share of young people aged 18–24 years who are not in education, employment or training (the so-called NEET rate). It is expressed as a percentage of the population of the same age. OECD data are at the level of the region; ILO data are national estimates for urban areas or, when unavailable, national estimates.

Source: OECD Regions, cities and local areas database (<http://oe.cd/geostats>) and International Labour Organization, ILOSTAT (<https://ilostat.ilo.org/>)

2.2.4 POPULATION WITH TERTIARY EDUCATION

Population with tertiary education (%) | 2019

Population with tertiary education refers to the percentage of the population aged 25-64 years whose highest educational attainment is at the tertiary level. The tertiary level is based on International Standard Classification of Education (ISCED) levels 5-8. OECD data are at the level of the region; ILO and UNESCO data are national estimates.

Source: OECD Regions, cities and local areas database (<http://oe.cd/geostats>); International Labour Organization, ILOSTAT (<https://ilostat.ilo.org/>); UNESCO Institute for Statistics, UIS.Stat (<https://databrowser.uis.unesco.org/>); local and national statistics

3 SUSTAINABILITY

3.1 URBAN DESIGN

3.1.1 AIR QUALITY

Population exposure to particulate matter (PM2.5) | 2023

Air quality is captured by exposure of the population to particulate matter of less than 2.5 microns of diameter (microgrammes per cubic metre).

Source: OECD Regions, cities and local areas database (<http://oe.cd/geostats>); UN-Habitat (<https://data.unhabitat.org/>); WHO Ambient Air Quality Database (<https://www.who.int/data/gho/data/themes/air-pollution/who-air-quality-database>)

3.1.2 GREEN AREAS

Green area in urban centres (% of land area) | 2022

This indicator refers to the share of green area in urban centres of Functional Urban Areas (FUAs), expressed as a percentage of total land area.

Source: OECD Regions, cities and local areas database (<http://oe.cd/geostats>); UN-Habitat (<https://data.unhabitat.org/>). Data for Singapore come from Singapore Ministry of National Development (<https://www.mnd.gov.sg/newsroom/parliament-matters/q-as/view/written-answer-by-ministry-of-national-development-on-green-cover>)

3.1.3 ACCESS TO OPEN PUBLIC SPACES

Population with convenient access to open public spaces (%) | 2025

Convenient access to open public spaces is defined as an open public space being 'within a walking distance of 400 meters along the street network'. The indicator is expressed as a percentage of total city population. It is one of the indicators included in Sustainable Development Goal (SDG) 11: Make cities and human settlements inclusive, safe, resilient and sustainable (Indicator 11.7.1).

Source: United Nations, Global SDG Indicators Database (<https://unstats.un.org/sdgs/dataportal/database>), sourced from UN-Habitat

3.2 ENERGY AND WASTE

3.2.1 GHG EMISSIONS

Greenhouse gas emissions (tonnes of CO2-equivalent per capita) | 2023

This indicator refers to the average amount of greenhouse gases emitted by a person, expressed in terms of tonnes of CO2-equivalent. Data from the EDGAR database are at the sub-national level, whereas national-level estimates are drawn from the World Development Indicators database.

Source: EDGAR (Emissions Database for Global Atmospheric Research) Community GHG Database, a collaboration between the European Commission, Joint Research Centre (JRC), the International Energy Agency (IEA), and comprising IEA-EDGAR CO2, EDGAR CH4, EDGAR N2O, EDGAR F-GASES version 2024 European Commission, JRC (Datasets); Crippa, Monica; Guizzardi, Diego; Pagani, Federico; Pisoni, Enrico; (2024): GHG Emissions at sub-national level (v3.0). European Commission, Joint Research Centre (JRC) [Dataset]:doi:10.2905/D67EEDA8-C03E-4421-95D0-0ADC460B9658 PID: <http://data.europa.eu/89h/d67eeda8-c03e-4421-95d0-0adc460b9658>; World Development Indicators of the World Bank (<http://data.worldbank.org/data-catalog/world-development-indicators>)

3.2.2 WASTE COLLECTION

Municipal solid waste (MSW) collection coverage (% of MSW generated) | 2019

Waste collection refers to the amount of municipal solid waste collected, expressed as a share of the amount of MSW generated.

Source: United Nations, Global SDG Indicators Database (<https://unstats.un.org/sdgs/dataportal/database>); World Bank, What A Waste Global Database (<https://datacatalog.worldbank.org/search/dataset/0039597>); local and national statistics

3.2.3 RENEWABLE ELECTRICITY

Electricity production from renewable sources (% of total production) | 2024

Renewable electricity refers to the amount of electricity production that comes from renewable sources, expressed as a share of total electricity production.

Source: OECD, Measuring the distance to the SDGs in regions and cities (<https://www.oecd-local-sdgs.org/>), based on the Global Power Plant Database; World Development Indicators of the World Bank (<http://data.worldbank.org/data-catalog/world-development-indicators>)

4 INSTITUTIONS & GOVERNANCE

4.1 INSTITUTIONS

4.1.1 RULE OF LAW

Rule of law indicator | 2023

The rule of law indicator 'captures perceptions of the extent to which agents have confidence in and abide by the rules of society, and in particular the quality of contract enforcement, property rights, the police, and the courts, as well as the likelihood of crime and violence'. Scores are standardised (–2.5 = low; 2.5 = high).

Source: World Bank, Worldwide Governance Indicators, 2024 Update (www.govindicators.org)

4.1.2 REGULATORY QUALITY

Regulatory quality indicator | 2023

The regulatory quality indicator 'captures perceptions of the ability of the government to formulate and implement sound policies and regulations that permit and promote private sector development'. Scores are standardised (–2.5 = low; 2.5 = high).

Source: World Bank, Worldwide Governance

Indicators, 2024 Update (www.govindicators.org)

4.2 GOVERNANCE

4.2.1 GOVERNMENT EFFECTIVENESS

Government effectiveness indicator | 2023

The government effectiveness indicator 'captures perceptions of the quality of public services, the quality of the civil service and the degree of its independence from political pressures, the quality of policy formulation and implementation, and the credibility of the government's commitment to such policies'. Scores are standardised (–2.5 = low; 2.5 = high).

Source: World Bank, Worldwide Governance Indicators, 2024 Update (www.govindicators.org)

4.2.2 CONTROL OF CORRUPTION

Control of corruption indicator | 2023

The control of corruption indicator 'captures perceptions of the extent to which public power is exercised for private gain, including both petty and grand forms of corruption, as well as "capture" of the state by elites and private interests'. Scores are standardised (–2.5 = low; 2.5 = high).

Source: World Bank, Worldwide Governance Indicators, 2024 Update (www.govindicators.org)

5 TRANSPORT & INFRASTRUCTURE

5.1 MOBILITY

5.1.1 TRAFFIC SAFETY

Fatal transport accidents (per 100,000 people) | 2024

Traffic safety refers to the total number of deaths resulting from transport accidents, expressed as a rate out of 100,000 people. UN-Habitat data are at the city-level, OECD data are at the regional level, WHO data are at the national level.

Source: OECD Regions, cities and local areas database (<http://oe.cd/geostats>); UN-Habitat (<https://data.unhabitat.org/>); World Health Organization, Global Health Observatory (<https://www.who.int/data/gho>). Data for Hong Kong and Taipei City are taken from, respectively, HK Census and Statistics Department (<https://www.censtatd.gov.hk/en/EindexbySubject.html?scode=340&pcode=FA100071>) and the Road Traffic

Safety Portal Site, Taiwan (<https://168.motc.gov.tw/en/>).

5.1.2 ACCESS TO PUBLIC TRANSPORT

Convenient access to public transport (% of population) | 2024

This indicator refers to the accessibility of an urban population to a public transport stop. UNSDG measures access to public transport in terms of distance (500 metres from a reference point), whereas OECD measures it in terms of time (a period of 10 minutes has been selected for the CFRI). Accessibility is, in both cases, expressed as a percentage of population.

Source: *OECD Regions, cities and local areas database* (<http://oe.cd/geostats>); United Nations, *Global SDG Indicators Database* (<https://unstats.un.org/sdgs/dataportal/database>), sourced from UN-Habitat and official national statistics.

5.1.3 TRAFFIC TRAVEL TIMES

Average travel time per 10 km | 2024

The TomTom Traffic Index summarises traffic flows in 501 city centres and metro areas derived from floating car data, i.e. Global Positioning System (GPS) data that have been retrieved from satnav systems. *Traffic travel times* is one of the indicators included in the index and refers to the average time it would take in a metro area to travel 10 km based on a sample of annual data.

Source: TomTom Traffic Index, 2024 ranking (<https://www.tomtom.com/traffic-index/ranking/>).

5.1.4 AIRPORT CONNECTIVITY

Airport passenger traffic (per 100 people) | 2024

This indicator refers to the number of passengers that fly into and out of the international airport(s) of a metro area during a calendar year, weighted by the population of the FUA.

Source: France Aviation Civile Services (April 2025) *Air Transport Data Bulletin* (<https://fracs.aero/2025/04/29/air-transport-data-bulletin-april-2025/>); official reports and statistics; news reports; Wikipedia (<https://www.wikipedia.org/>).

5.2 DIGITAL INFRASTRUCTURE

5.2.1 MOBILE DOWNLOAD SPEED

Median download speed for mobile networks (Megabits per second) | 2024

This indicator refers to the median download speed for mobile networks, expressed in terms of Megabits per second (Mbps).

Source: Ookla® Speedtest Global Index™ (<https://www.speedtest.net/global-index>).

5.2.2 FIXED BROADBAND DOWNLOAD SPEED

Median download speed for fixed broadband networks (Megabits per second) | 2024

This indicator refers to the median download speed for fixed broadband networks, expressed in terms of Megabits per second (Mbps).

Source: Ookla® Speedtest Global Index™ (<https://www.speedtest.net/global-index>).

5.2.3 INTERNET ACCESS

Households with internet broadband access (% of total households) | 2024

Internet access refers to the number of households that have access to internet broadband, expressed as a percentage of all households. UN-Habitat data are predominantly at the city-level, OECD data are at the regional level, data from the International Telecommunication Union (ITU) either relate to urban areas in a country or are at the national level.

Source: International Telecommunication Union (ITU), *ITU DataHub* (<https://datahub.itu.int/>); OECD *Regions, cities and local areas database* (<http://oe.cd/geostats>); UN-Habitat (<https://data.unhabitat.org/>)

6 INNOVATION

6.1 R&D INTENSITY

6.1.1 R&D EXPENDITURE

Gross domestic expenditure on research and development (% of GDP) | 2023

R&D expenditure refers to the total gross domestic expenditure on research and development (GERD), expressed as a percentage of GDP. GERD includes spending from all types of sources: government, firms, higher education institutions, and private non-profit organisations. OECD data are at the regional level, while UNESCO data are at the national level.

Source: OECD Regions, cities and local areas database (<http://oe.cd/geostats>); UNESCO Institute for Statistics, UIS.Stat (<https://databrowser.uis.unesco.org/>)

6.1.2 MAJOR UNIVERSITY

Top-ranked university | 2022

This indicator refers to the score of the top university of a city in the QS World University Ranking. A city without any university in the ranking is given a score of 0. It is based on six indicators (with their weights in parentheses): (1) Academic reputation from the QS global survey (40%), (2) Employer reputation from the QS global survey (10%), (3) Citations per faculty from SciVerse Scopus database (20%), (4) Faculty-student ratio (20%), (5) Proportion of international students (5%), and (6) Proportion of international faculty (5%).

Source: Quacquarelli Symonds Ltd (QS), QS World University Ranking 2023, Top Universities (<https://www.topuniversities.com/qs-world-university-rankings>)

6.2 INTELLECTUAL PROPERTY INTENSITY

6.2.1 PATENTS

Patent applications (per 1 million population) | 2022

Patents refers to the number of patent applications filed under the Patent Cooperation Treaty (PCT), expressed as per million population.

Source: OECD (2024), "Metropolitan areas", OECD Regional Statistics (database), OECD, Paris (<https://doi.org/10.1787/data-00531-en>); World Intellectual Property Organization (WIPO), PATENTSCOPE database (<https://patentscope.wipo.int/search/en/search.jsf>)

6.2.2 SCIENCE AND TECHNOLOGY OUTPUT

Science and technology cluster score | 2023

The science and technology (S&T) cluster score has been developed by the World Intellectual Property Organization as part of its Global Innovation Index. The S&T cluster score is based on two indicators related to innovation: patent applications and scientific articles. More specifically, a cluster's score is calculated on data on (i) inventors listed on patent applications filed under the PCT and (ii) authors of academic scientific articles of original research. Data on patent applications are from the WIPO's PCT patent dataset and scores are based on aggregates for 2019-2023. Data on scientific publications are from the Web of Science's Science Citation Index Expanded (SCIE), where scores are based on aggregates for 2018-2022.

Source: World Intellectual Property Organization (WIPO) (2024) *Global Innovation Index 2024: Unlocking the Promise of Social Entrepreneurship*, Geneva (10.34667/tind.50062). Values for cities not included in the *Global Innovation Index* are based on own computation where patent data have been sourced from WIPO's PATENTSCOPE database, while data on scientific publications have been sourced from, primarily, the CWTS Leiden Ranking (<https://www.leidenranking.com/>, itself based on data from the Web of Science) or SciSpace (<https://scispace.com/>)

6.2.3 SCIENCE AND TECHNOLOGY INTENSITY

Science and technology intensity score (per 1 million population) | 2023

The science and technology (S&T) intensity score has been developed by the World Intellectual Property Organization as part of its Global Innovation Index. It is based on the same data underlying the S&T cluster score (see 6.2.2 Science and technology output), but the data have been weighted by 1 million population.

Source: World Intellectual Property Organization (WIPO) (2024) *Global Innovation Index 2024: Unlocking the Promise of Social Entrepreneurship*, Geneva (10.34667/tind.50062). Values for cities not included in the *Global Innovation Index* are based on own computation where patent data have been sourced from WIPO's PATENTSCOPE database, while data on scientific publications have been sourced from, primarily, the CWTS Leiden Ranking (<https://www.leidenranking.com/>, itself based on data from the Web of Science) or SciSpace (<https://scispace.com/>)

7 VIBRANCY

7.1 FINANCIAL ACTIVITY

7.1.1 STARTUP SCENE

Startup ecosystem | 2025

This indicator refers to city scores in the Global Startup Ecosystem Index published by the StartupBlink. The index is composed of three pillars — Quantity, Quality, and Startup Business Environment — that each contains a number of indicators, including number of startups and investors, size of investment and market capitalisation, and cost of internet and availability of startup and nomad visas.

Source: StartupBlink, *Global Startup Ecosystem Index 2025* (<https://www.startupblink.com/>)

7.1.2 FIRM OWNERSHIP LINKAGES

Number of subsidiaries owned by headquarters | 2022

Firm ownership linkages reflects city power as it captures the extent to which a city's firms controls firms in other cities. In particular, the indicator refers to the total of 'number of subsidiaries owned outside of the LUR [Large Urban Region] by the headquarters of the LUR'.

Source: Bureau Van Dijk (BvD) ORBIS – Citadyne UNIL, Rozenblat, 2025; Citadyne UNIL, Rozenblat, 2024: V2.1, *Large Urban Regions of the World* database (<https://zenodo.org/records/10458207>); Rozenblat C. (2020) *Extending the concept of city for the delineation of large urban regions (LUR) for the cities of the world*, Cybergeo, N°35411, 51 p. (<https://doi.org/10.4000/cybergeo.35411>)

7.1.3 FIRM SUBSIDIARY LINKAGES

Number of headquarters owning subsidiaries | 2022

Firm subsidiary linkages reflects city attractiveness as it captures the extent to which firms headquartered in other cities control a city's firms. In particular, the indicator refers to the total 'number of headquarters outside of the LUR [Large Urban Region] owning subsidiaries of the LUR'.

Source: Bureau Van Dijk (BvD) ORBIS – Citadyne UNIL, Rozenblat, 2025; Citadyne UNIL, Rozenblat, 2024: V2.1, *Large Urban Regions of the World* database (<https://zenodo.org/records/10458207>); Rozenblat C. (2020) *Extending the concept of city for the delineation of large urban regions (LUR) for the cities of the world*, Cybergeo, N°35411, 51 p. (<https://doi.org/10.4000/cybergeo.35411>)

7.2 CULTURAL ACTIVITY

7.2.1 MUSEUMS

Number of museums | 2025

This indicator refers to the total number of museums located within a city.

Source: Own computation based on manual search

7.2.2 ANNUAL EVENTS

Top-20 annual events | 2025

This indicator refers to the total number of top-20 annual events taking place in a city. The type of events covered include the following: financial events, policy events, sports events, cultural events, and technology events.

Source: Own computation based on manual search

7.2.3 TOP RESTAURANTS

Top-ranked restaurants | 2025

Top restaurants refers to the total number of restaurants in a city that feature in the La Liste selection of top 1000 restaurants in the world.

Source: La Liste, Top 1000 Restaurants 2025 (<https://www.laliste.com/en/laliste/world>)

8 E-READINESS

8.1 DATA READINESS

8.1.1 LOCAL ONLINE SERVICES

Local Online Service Index | 2024

The Local Online Service Index (LOSI) is the city-level component of the United Nations E-Government Knowledgebase (UN-EgovKB) benchmarking tool on e-government development. The LOSI assesses the quality of a local government's delivery of online services on a 0-to-1 (best) scale. More specifically, it analyses e-government development based on the performance of cities in 95 indicators across six dimensions: institutional framework (5 indicators), content provision (30), services provision (30), participation and engagement (10), technology (10), and e-government literacy (10). For cities without data, values are proxied by available data from a city of the same country.

Source: United Nations Department of Economic and Social Affairs (UNDESA), UN E-Government Knowledgebase (<https://publicadministration.un.org/egovkb/en-us/Data/City>)

8.1.2 DATA READINESS ENGAGEMENT

Local e-government engagement | 2025

This indicator refers to the engagement of the local government in initiatives related to e-government development. In particular, it considers whether a city is engaged in four initiatives related to open data, smart cities, and digital rights: (i) existence of a functioning open data portal; (ii) membership of the Open Government Partnership (OGP); (iii) membership of the World Smart Sustainable Cities Organization (WeGO); and (iv) membership of the Cities Coalition for Digital Rights.

Source: Own computation based on local government websites, the Open Government Partnership (<https://www.opengovpartnership.org>), the World Smart Sustainable Cities Organization (<https://we-gov.org/>), and the Cities Coalition for Digital Rights (<https://citiesfordigitalrights.org>).

8.2 AI READINESS

8.2.1 SOFTWARE DEVELOPMENT

GitHub commits (per 1,000 population) | 2018

GitHub is the world's largest host of source code, and a *commit* is the term used for a saved change on this platform. *GitHub commits* therefore refers to the number of saved changes on the GitHub website that are publicly available.

Source: Gousios, G. (2013), *The GHTorrent dataset and tool suite*. Data accessed through Google BigQuery.

8.2.2 AI PATENTS

Number of applications for AI-related patents (per million population) | 2018

This indicator refers to the count of applications filed under the Patent Cooperation Treaty (PCT) in technologies related to artificial intelligence by priority date and inventor nationality. More specifically, it covers patent applications that include any of the terms "artificial intelligence", "machine learning", "deep learning", or "neural network". The count is given per million people in the FUA's population.

Source: Own computation based on data accessed from World Intellectual Property Organization (WIPO), PATENTSCOPE database (<https://patentscope.wipo.int/search/en/search.jsf>)

Technical Annex

Mikhail Rogov, Céline Rozenblat
University of Lausanne

Defining cities to compare them in global corporate networks

Cities today are not only places where people live, work, and use services, they are also important nodes in large corporate networks around the globe. Headquarters and subsidiaries of multinational firms create flows of capital, knowledge, and decision-making power that bind cities together across continents. Understanding these flows necessitates the move beyond narrow municipal city boundaries, as firms rarely constrain their activities to a single administrative unit. For example, a company may register its headquarters in the core of London, but its main research labs may be in Oxford, its logistics hubs near Heathrow airport, and its production facilities in Milton Keynes and spread across the wider South-East England region. If we measured London only within its municipal limits, we would underestimate its true role in the global economy (Rozenblat, 2021).

1. Why City Delineation Matters

Defining what is considered as a “city” is far from straightforward. Researchers and policy makers often speak of cities as if they were universally comparable units, but in reality, their territorial boundaries are defined in very different ways. In a political context, a city refers to a municipality with fixed administrative borders, as in London city, Paris or Vienna. However, cities should be considered as “systems within systems of cities” (Berry, 1964): they are dense local agglomerations, but also nodes embedded in larger regional, national, and global networks (Rozenblat & Pumain, 2018). A definition limited to municipal borders misses this complexity. The municipality should be completed by a larger metropolitan region such as Greater London, Grand Paris or Greater Vienna, including numerous surrounding municipalities which together form a regional system supporting the core. In fact, commuting flows, infrastructure use, and firm networks all transcend local government boundaries. Most of the time, these urban

regions are in fact organized around one single core, but we see more and more dense regions composed of several main cores forming conurbations (like the Ruhr in Germany, or the North-Eastern American metropolis from Boston to Washington DC, the Tokyo – Yokohama agglomeration in Japan, the Pearl River Delta in China to only cite few). There are also new forms of “desakota”¹ territories mixing a dense set of medium size cities and rural areas, frequently found in Asia.

For policy making, the implications are serious. One city will appear smaller and less connected simply because its administrative borders exclude most of its metropolitan population and firms. This undermines the ability of city leaders and national governments to benchmark their performance, design effective strategies, and learn from international best practices. The problem is even more important for relational indicators such as City Power (the ability of a city's firms to control subsidiaries elsewhere) and City Attractiveness (the capacity to host subsidiaries from outside). These measures depend on understanding cities as functional regions where corporate decisions and investments are made, not just as narrow administrative units. If boundaries are inconsistent, the picture of global corporate linkages will be skewed, obscuring which cities are command centers and which are primarily hosts of global capital.

In addition, whatever the vision of “cities” we adopt, criteria to define them vary from a country to another: some countries use various demographic thresholds (e.g., 5,000 or 10,000 inhabitants), others consider the presence of administrative functions. Sometimes wider urban regions are defined through various criteria such as commuting flows, infrastructures or densities with different thresholds, or institutional governments. This results in a set of definitions that are not comparable worldwide (Rozenblat, 2020). Comparative urban studies require consistent units of analysis, however the object of study varies depending on national conventions and data availability. Without a consistent and harmonized delineation, research risks underestimating the real scale of urban systems and misrepresent their role in globalization.

¹The term *desakota*, introduced by geographer Terry McGee (2013) from the Indonesian words for “village” and “town,” describes densely populated zones in East and Southeast Asia where agricultural and non-agricultural activities coexist. These areas mix farming, industry, and services, with households combining rural and urban livelihoods and frequent daily mobility between them.

Therefore, the delineation of cities is not a minor detail but the foundation of meaningful international urban comparisons. It is both a research challenge of how to build harmonized, comparable urban units across diverse contexts, and a policy challenge of how to ensure that urban indicators reflect the “realities” concerning their role and place in globalization.

2. Concepts to Define Harmonized Cities and Urban Areas

To enable more consistent international comparisons, researchers have identified several ways to define cities. These approaches provide a shared language for international city comparisons without removing the complexity of urban organization. Despite the diversity of national practices, most definitions can be grouped into four conceptual urban delineations (Pumain et al., 1992):

1. City as an urban locality (MUNI), defined by administrative boundaries or legal status, such as a municipality.
2. Morphological Urban Area (MUA), based on the continuous spread of built-up areas that may cross several administrative units.
3. Functional Urban Areas (FUA), which links the core city to its surrounding zone through commuting and labor market flows.
4. Polynuclear Urban Regions that are large, interconnected systems of cities that were once separate but have grown together through population and economic integration.

To illustrate these four nested urban concepts, let's take as an example the Geneva region in Western Switzerland (Fig. 1).

Figure 1. Delineation of the Geneva Large Urban Region (LUR)

The Geneva area shows how urban development and daily life increasingly extend across administrative and even national borders. About a quarter of Geneva's workforce consists of cross-border commuters from France, many of whom live in neighboring towns like Annemasse (Canton de Genève, 2023). The Geneva International Airport (GVA) is directly on the Swiss-French border, with part of its facilities located on French territory under a special bilateral agreement that allows a controlled border crossing within the airport itself. Along the Northern shore of the Geneva Lake, continuous urbanization connects Geneva with the Swiss cities of Lausanne and Vevey-Montreux, forming a dense urban corridor: the Lemanic Arc. The three centers are linked by strong commuting flows and high-capacity and frequent transport connections, such as the direct rail lines to Geneva Airport. Despite their institutional independence at the cantonal and local levels, the three functional urban areas – Geneva, Lausanne, and Vevey-Montreux – are so interdependent that they need to coordinate across numerous economic and planning domains, together with the municipalities located between them. Collectively, they form what is referred to as the “Lemanic Metropolis” (Diener et al., 2013).

Therefore, the four urban concepts do not compete with one another, rather, they offer complementary perspectives to approach cities for different goals. Administrative localities remain important for governance and democracy, morphological agglomerations for planning the urban environment, functional regions for monitoring labor markets and social patterns, and polynuclear regions for analyzing global economic integration of city-regions. Taken together, they provide the foundation for building harmonized approaches to international city comparisons, allowing the scale of the delineation to vary depending on the specific issue being studied.

3. Bottom-up and Top-down Worldwide Initiatives on City Delineations

An important issue appears in the implementation of these concepts at the world scale. Over the last decades several international initiatives have tried to provide common ground for urban comparisons. These efforts reflect two broad strategies: “bottom-up” approaches that start from national definitions and attempt to harmonize them, and “top-down” approaches that apply uniform methods across countries using new forms of data such as satellite pictures. Each has its strengths and limitations, and

together they illustrate why finding a shared definition of cities is both technically complex and politically sensitive.

The United Nations was among the first to gather international data on urban populations, beginning in 1948. Its approach has relied on national governments' own definitions of what is considered as urban. Since 2018, they qualify the concept used by each country, by three categories corresponding to those we presented above: “City proper”, delineated by administrative boundaries; “Urban agglomeration”, delineated by the morphological urban area; “Metropolitan area”, delineated by the functional urban area. (Rozenblat, 2020). This ensured wide coverage, but the produced statistics remain difficult to compare on the international level.

In reaction to these limits, the European Union and the OECD developed the concept of Functional Urban Areas . It led to the Global Human Settlement Layer (GHSL), coordinated by the European Commission's Joint Research Centre. GHSL uses satellite imagery and population grids to identify built-up areas and estimate population densities. This allows consistent delineations across the globe, even in places where national statistics is weak. However, as recent research on African cities has shown, thresholds designed for European or North American contexts often fail to capture the urban realities of rapidly growing cities in the Global South, leading to over- or under-estimations of urban populations (Dorward et al., 2023; Rogromel & Rozenblat, 2024).

The Atlas of Urban Expansion uses both historical and modern data to trace how cities have physically evolved over time. The Atlas has a global sample of about 200 cities and combines archival maps, satellite imagery, and Geographic Information Systems (GIS) analysis to construct urban land-cover maps for different historical periods. Through this combination of historical documents and remote sensing, the Atlas shows how urbanization unfolds unevenly across the globe, offering a rich empirical data for designing policies on land use and infrastructure planning.

All these initiatives highlight a fundamental tension: bottom-up approaches are sensitive to national contexts and governance realities, but they lack comparability, whereas top-down approaches are globally consistent, but they can misrepresent local conditions. This tension is particularly evident in countries with complex urban hierarchies, such as Russia, where the mismatch between municipal

boundaries of a city and real urban economies obscures the role of major cities like Moscow and St. Petersburg in multinational firm networks (Rogov & Rozenblat, 2020).

4. Coupling Bottom-up and Top-down: The Large Urban Regions (LUR)

By coupling bottom-up and top-down approaches, we proposed the Large Urban Regions (LUR) framework (Rozenblat, 2020) that integrates these urban delineations into a nested structure (municipalities => MUAs => FUAs => LURs), allowing cities to be compared in ways that are both globally consistent and locally meaningful. This nested iterative construction makes it possible to reflect both the physical spread of urbanization and the functional integration of labor markets, infrastructures, and corporate networks. This layered approach provides a practical solution to the problem of comparing cities across the world without losing sight of the realities of urban life and economic networks.

A distinctive strength of the LUR framework is its ability to incorporate strategic functions of cities into urban definition criteria. For example, the presence of international airports or multinational firms is used to verify whether a functional region has the connectivity and capacity that make it a global urban player. This makes LURs particularly suited for indices like the Cities Future Readiness Index, where the objective is not only to measure internal qualities such as health, education, or infrastructure, but also to assess how cities are embedded in international flows of investment, innovation, and corporate decision-making.

The value of this approach lies not only in its conceptual clarity but also in its practical implementation. An open global database identifying 1,828 Large Urban Regions worldwide with their composition including 135,760 municipalities, 17,909 MUAs and 6,140 FUAs (Rozenblat et al., 2024). The database is open access, regularly updated and provides a transparent and replicable basis for comparative urban studies. By combining national delineations with harmonized rules, it offers a pragmatic compromise: cities remain rooted in their local institutional contexts but can also be compared internationally on a consistent footing.

The example of Geneva LUR above (Fig.1) illustrates how the concept of polynuclear regions captures shared economic and social space, held together by daily mobility, joint infrastructure, and a network

of international firms and institutions (Hall & Pain, 2006). By recognizing these linkages, harmonized delineations such as LURs make it possible to describe and compare complex metropolitan realities like Geneva's with other global urban regions.

For policy makers, the adoption of LURs has two major implications. First, it ensures that international comparisons reflect cities' systems, rather than as they appear within administrative boundaries. Second, it provides a dynamic framework that can be updated as cities expand, merge, or reconfigure. This adaptability is crucial at a time when urban regions are growing rapidly, especially in Africa and Asia, where peri-urban expansion and the emergence of polycentric mega-regions are transforming the map of global urbanization (Rogromel & Rozenblat, 2024). Temporal comparisons are possible by using the last updated LUR delineations, and by applying them retroactively to previous years. This is what we do when we regularly update the corporate networks database every 3 years. Therefore, it is possible to compare cities' integration in these corporate networks for different years.

5. Identifying Cities' Power and Attractiveness through the lens of LURs

LURs are used to compare cities worldwide based on corporate ownership networks for the years 2010, 2013, 2016, 2019 and 2022 using the Bureau van Dijk ORBIS database. This database is a specific extraction of the direct and indirect subsidiaries of the 3,000 largest corporations of the world by their turnover for each year. Subsidiarity is considered over 10% to avoid the volatile investments. In 2022, 1.7 million enterprises were located in the LURs and 2.9 million-ownership links between headquarters and subsidiaries were mapped globally. In most cases, cities are both controlling firms outside and are controlled from outside and are even places of local coordination with the emergence of numerous links between local firms (Fig. 2). When these links are aggregated at the level of LURs, they reveal patterns of command and control in global economic networks that are invisible at narrower scales (Rozenblat, 2021; Rogov & Rozenblat, 2024). Cities emerge in such LURs' global networks not only as local centers of employment but also as powerful hubs of coordination, projecting influence outward by controlling subsidiaries elsewhere, or drawing in investment and expertise by hosting subsidiaries from other global centers.

Figure 2. Building cities' power and attractiveness through multinational corporation networks

This distinction between outward and inward linkages is at the core of the two new indicators of this index that enrich our understanding of cities' future readiness. City Power measures the capacity of firms headquartered in a given LUR to control subsidiaries in other places. It is a proxy for outward influence and global command capacity. City Attractiveness, by contrast, captures the number of subsidiaries hosted in a LUR that are controlled by firms based elsewhere. It is an indicator of how well a city integrates into global networks and attracts foreign capital and talent. Both indicators highlight the asymmetric roles cities can play: some project power outward as decision-making centers, while others thrive by positioning themselves as attractive hosts for international investment (Rozenblat, 2021; Rogov & Rozenblat, 2024).

For policy makers, the relevance of this framework is clear. Measuring only local characteristics - such as infrastructure, education, or quality of life - tells us much about conditions inside a city but little about

how it connects to and depends on the wider world. The relational perspective adds a crucial dimension: it shows whether a city is primarily an exporter of corporate decisions, an importer of global investment, or both.

Applying the LUR framework to the assessments of cities' future readiness can make it more realistic and more actionable. A metropolitan region that appears modest when measured by municipal population may in fact be a significant global hub of corporate power once its full LUR is considered. Conversely, a city that looks attractive in terms of inward investment may depend heavily on decisions made elsewhere, revealing potential vulnerabilities. The LUR framework thus provides the robust foundation needed to interpret City Power and City Attractiveness in a consistent and globally comparable way.

6. Conclusion

The key message is that there is no single, universally accepted definition of cities. Instead, there is a toolbox of approaches, each providing insights into different dimensions of urban life. What is important, it is to bridge the gap between bottom-up and top-down perspectives, and this is the aim of the recent work on Large Urban Regions (LURs), which integrates national definitions with global data sources to create harmonized and comparable city delineations to ensure that international urban comparisons capture cities with their regional systems, rather than as they are administratively defined. Using the LUR definition, cities can be assessed on a fair and consistent basis, both in terms of their local capacities and their external roles in global networks. This dual perspective linking the local with the global provides a stronger foundation for designing strategies, benchmarking performance, and preparing cities for the challenges of the future.
